### A Taste of Python And Its Capabilities

Emily Wolin Northwestern University

#### Goal: Overview of Python basics, with some hands-on examples

Download examples at <u>www.earth.northwestern.edu/</u> <u>~emilyw/pythonbasics.tgz</u>

### What is Python?

- Interpreted
- High-level
- Free and open-source
- Object-oriented: each object has various attributes and methods

"How good are current tomographic models of North America?"

"How good are current tomographic models of North America?"

"We can use current tomographic models to predict S and Rayleigh wavetrains from earthquakes within North America. Do these synthetic seismograms agree with observations at SPREE and the TA?"

Things I need to know to compare two waveforms:

- Time series of ground motion (of course)
- Station, network, component, location
- Lat, lon, depth of station
- Start and end time of traces
- Sampling rate
- Event hypocenter and origin time
- Phase picks

SAC deals with headers nicely and provides a lot of nice functions.

But I hate writing SAC macros.

And I need to do things that SAC can't do.

#### Why do I use Python? Goal: Measure misfit between observed and synthetic seismograms

In Python, I could build an *object* containing the time series and the headers.

- mytrace.header.stnm
- mytrace.header.stla
- mytrace.data

#### attributes

I could also define functions that act on or modify the object's attributes.

mytrace.trim(starttime=t1, endtime=t2)

mytrace.filter("highpass", freq=0.02)

mytrace.remove\_response(output="DISP")

Note: these are all pseudocode

methods

Good news:

Seismology-friendly data structures already exist in a package called ObsPy.

Even better news:

I can use powerful numerical and scientific Python libraries to process and visualize my data. Tip: Use a text editor with syntax highlighting. In Vim (my favorite), set up ~/.vimrc:

syntax on

set number

set noeb vb t\_vb=

(turn on syntax highlighting and line numbers; turn off annoying beeps)

In a terminal window, type ipython --pylab

In a terminal window, type ipython --pylab

#### print('Hello, world!')

a='1'	str
a=1	int
a=1.1	float
a=1+2j	complex

#### Getting started: IPython $a=[42, 17, 6] \leftarrow a list$ a[1] a. < tab >in IPython, use <tab> and ? to explore attributes/methods of an object

s='hello there '← a string
s[1]
s.<tab>
 in IPython, use <tab> and ? to explore
 attributes/methods of an object

if answer != 42:

print('that is not correct')
for i in range(5):
 print('Hello, world!')
 Spaces! (4)

### Using modules

Python doesn't load modules unless you ask for them

- import os
- help(os)

os.environ — a dictionary

myname=os.environ['USER']

### Write your own module

In a file called mymodule.py:

import os
def sayhello(): ← a function
 myname=os.environ['USER']
 print('Hello, {0}!'.format(myname))

def addthese(a,b): ← a function with arguments
 c=a+b
 print('{0}+{1}={2}'.format(a,b,c))
 return c

### Use your new module

#### In the IPython shell:

import mymodule
mymodule.sayhello()
a=mymodule.addthese(3.1,2.7)

#### Or, if your fingers are getting tired:

import mymodule as mm
mm.sayhello()
a=mm.addthese(3.1,2.7)

### Using classes

We can define a class (an object) that has its own attributes and methods.

from birdclasses import Swallow
bird=Swallow(species='African', loadstatus='unladen')
bird.loadstatus
bird.velocity

### Using classes

We can define a class (an object) that has its own attributes and methods.

from birdclasses import Swallow
bird=Swallow(species='African', loadstatus='unladen')
bird.loadstatus
bird.velocity

Try giving the bird a coconut: bird.giveCoconut() What is the airspeed velocity of an unladen swallow?

http://style.org/unladenswallow/

#### NumPy:

"the fundamental package for scientific computing with Python. It contains among other things:

- a powerful N-dimensional array object
- sophisticated (broadcasting) functions
- tools for integrating C/C++ and Fortran code
- useful linear algebra, Fourier transform, and random number capabilities"

http://www.numpy.org/

matplotlib:

"matplotlib is a python 2D plotting library which produces publication quality figures in a variety of hardcopy formats and interactive environments across platforms"

http://matplotlib.org/

SciPy:

"a collection of numerical algorithms and domain-specific toolboxes, including signal processing, optimization, statistics and much more"

<u>http://www.scipy.org/about.html</u>

ObsPy:

"an open-source project dedicated to provide a Python framework for processing seismological data. It provides parsers for common file formats and seismological signal processing routines which allow the manipulation of seismological time series"

<u>http://docs.obspy.org/</u>

### Python Basics

Now you know a little about:

- Data types
- Object orientation: attributes, methods
- Flow control statements (if/while/for): mandatory indentation
- Importing modules and writing simple functions

# And now for something a little different...

Sample code (mylinefit.py):

- Generate a linearly-spaced array of x values
- Calculate a function y(x) at each point
- Add random noise to y(x)
- Fit a line through the noisy data
- Plot the noisy data, original function, and best-fit line

Run script from IPython: run mylinefit.py

Run script from IPython: run mylinefit.py

Run in Terminal:

chmod +x mylinefit.py

./mylinefit.py

(The first line of mylinefit.py should be

#!/usr/bin/env python

so the shell knows this is a Python program.)

Fit line in 2 ways:

- SciPy: stats.linregress module
- "By hand" with NumPy matrices and some inverse theory

 $y_n = ax_n + b$   $\mathbf{G}\mathbf{m} = \mathbf{d}$  $\mathbf{m} = \left(\mathbf{G}^{\mathrm{T}}\mathbf{G}\right)^{-1}\mathbf{G}^{\mathrm{T}}\mathbf{d}$ 

 $\mathbf{G} = \begin{bmatrix} x_1 & 1 \\ x_2 & 1 \\ \vdots & \vdots \\ x_n & 1 \end{bmatrix}$  $\mathbf{m} = \begin{bmatrix} a \\ b \end{bmatrix}$  $\mathbf{d} = \begin{bmatrix} y_1 \\ y_2 \\ \vdots \\ y_n \end{bmatrix}$ 

#### Fit line in 2 ways:

- SciPy: stats.linregress module
- "By hand" with NumPy matrices and some inverse theory

 $y_n = ax_n + b$  Gm = d $m = (G^TG)^{-1} G^T d$ 

 $\mathbf{G} = \begin{bmatrix} x_1 & 1 \\ x_2 & 1 \\ \vdots & \vdots \\ x_n & 1 \end{bmatrix}$  $\mathbf{m} = \begin{bmatrix} a \\ b \end{bmatrix}$ **d** =

#### Read and plot a waveform

from obspy import read
st = read('TA.SPMN..LHZ.disp')
st.plot()

Also try:
 print st
 len(st)
 tr = st[0]
 print tr
 print tr.stats
 print tr.stats['station']
 tr.data

#### Read and plot a waveform

from obspy import read
st = read('TA.SPMN..LHZ.disp')
st.plot()

Also try: 103089 68740 34391 print st 42 -34306 -68655 len(st) -103004 17:57:32 17:54:36 tr = st[0]print tr print tr.stats print tr.stats['station'] tr.data

#### Plot a focal mechanism

from obspy.imaging.beachball import Beachball
mt = [ 180, 80, 90 ]
Beachball(mt, size=500)

mt2 = [-0.463, 4.61, -4.15, -0.0633, -0.171, -1.49]
Beachball(mt2, size=500)

#### Plot a focal mechanism

from obspy.imaging.beachball import Beachball
mt = [ 180, 80, 90 ]
Beachball(mt, size=500)

mt2 = [-0.463, 4.61, -4.15, -0.0633, -0.171, -1.49]
Beachball(mt2, size=500)

Plot any two-column ASCII file from Terminal:

Plot any two-column ASCII file from Terminal:

chmod +x plotanything.py

- ./plotanything.py vs.ak135
- ./plotanything.py vs.\*

(Again, note the #!/usr/bin/env python in the first line of plotanything.py)

# If you want to learn more: IPython notebooks <u>http://docs.obspy.org/tutorial</u>

#### Then run the notebook (will open in a browser):

ipython notebook python\_introduction.ipynb --pylab inline

### Want to learn more?

#### http://scipy-lectures.github.io/index.html

#### AIMBAT: Teleseismic travel-time picking

www.earth.northwestern.edu/~xlou/aimbat.html

#### Thank you!

I DUNNO ... I JUST TYPED DYNAMIC TYPING? import antigravity WHITESPACE? THAT'S IT? COME JOIN US! PROGRAMMING ... I ALSO SAMPLED I LEARNED IT LAST 15 FUN AGAIN! EVERYTHING IN THE NIGHT! EVERYTHING IT'S A WHOLE MEDICINE CABINET 15 SO SIMPLE! NEW WORLD FOR COMPARISON. UP HERE! HELLO WORLD IS JUST print "Hello, world!" BUT I THINK THIS BUT HOW ARE IS THE PYTHON. YOU FLYING?

http://xkcd.com/353/

### Read and plot a waveform

from obspy.core import read  $st = read('http://examples.obspy.org/RJOB_061005_072159.ehz.new')$ print st len(st) tr = st[0]print tr print tr.stats print tr.stats['station'] tr.data tr.plot()

#### Importing: which style is best?

OK for IPython/quick testing
import mymodule
from mymodule import \*

Better for scripting!

import mymodule as mm /
from mymodule import sayhello, addthese

Beware of name clashes (and don't trust your memory)

### What's an object?

How could you describe an earthquake?

- Hypocenter (lat, lon, depth)
- Origin time
- Rise time/other source-time function
- Moment tensor
- Who contributed the solution (may be several solutions--ISC, PDE, Global CMT, etc.)?
- Event ID

It'd be nice if we had a way of tying all of these different pieces of information together.
